BIO 465: Northern Temperate Ecology

This course provides an introduction to the ecological concepts and basic field methods that are involved in the study of northern temperate to boreal fauna and flora, their populations, and the aquatic or terrestrial ecosystems in which they live.

A week of on-line sessions in biogeography, ecology, limnology, and zoology of the forest and stream/lake habitats in northern temperate ecosystems will be followed with a two-week study abroad program in Sweden. Hands-on field studies with Swedish students from Karlstad University during this program will occur at field sites in forests, and on lakes and streams in the vicinity of Karlstad.

MAY 12-26, 2018

Application Deadline– February 23, 2018
